LAB REPORT
on

Artificial Intelligence (23CS5PCAIN)

Submitted by

SHREYAS SINHA (1BM23CS321)

in partial fulfillment for the award of the degree of
BACHELOROFENGINEERING
in
COMPUTER SCIENCE AND ENGINEERING

B.M.S. COLLEGE OFENGINEERING
(Autonomous Institution under VTU)
BENGALURU-560019
Aug 2025 to Dec 2025

B.M.S. College of Engineering,
BullTempleRoad,Bangalore560019
(AffiliatedToVisvesvarayaTechnologicalUniversity, Belgaum)
DepartmentofComputerScienceandEngineering

CERTIFICATE

This is to certify that the Lab work entitled "Artificial Intelligence (23CS5PCAIN)" carried out by **SHREYAS SINHA (1BM23CS321),** who is bonafide student of **B.M.S. College of Engineering.** It
is in partial fulfillment for the award of **Bachelor of Engineering in Computer Science and Engineering** of the Visvesvaraya Technological University, Belgaum. The Lab report has been approved as it satisfies the academic requirements in respect of an Artificial Intelligence (23CS5PCAIN) work prescribed for the said degree.

Lab faculty Incharge Name Assistant Professor Department of CSE, BMSCE	Dr. Kavitha Sooda Professor & HOD Department of CSE, BMSCE

VACUUM CLEANER AGENT

Algorithm

1) Two Room Setup :-

(i) Start
(ii) Implement initial state with dust and vacuum cleaner with 2 rooms setup.
(iii) If vaccum cleaner is in room 'A', and dust is present suck it.
(iv) After cleaning A, ask user to move to room 'B' and clean the dust in B.
(v) Then move the cleaner back to A.
(vi) End.

2) 4- Room Setup :-

(i) Start.
(ii) Start at R1 and move through rooms in a specific path.
(iii) If R1 is not clean, clean the dust and then ask user for the next room.
(iv) Move to either R2 or R3 and then clean the dust in that rooms.
(v) Then repeat the process so that all the rooms are clean and the objective is achieved.
(vi) End

Code:

```
def vacuum_cleaner(): # Taking user input for the state of each room
state_A = int(input("Enter state of A (0 for clean, 1 for dirty): "))
state_B = int(input("Enter state of B (0 for clean, 1 for dirty): "))
state_C = int(input("Enter state of C (0 for clean, 1 for dirty): "))
state_D = int(input("Enter state of D (0 for clean, 1 for dirty): "))
location = input("Enter location (A, B, C, or D): ").upper()

cost = 0

rooms = {'A': state_A, 'B': state_B, 'C': state_C, 'D': state_D}

# Function to clean a room and update the cost def clean_room(room):

nonlocal cost
if rooms[room] == 1: print(f"Cleaned {room}.") rooms[room] = 0

print("Moving vacuum left")
clean_room('A')

elif location == 'D': clean_room('D')

print("Moving vacuum up")
clean_room('B')
print("Moving vacuum right")

clean_room('C')

print("Moving vacuum left")
clean_room('A')

else:

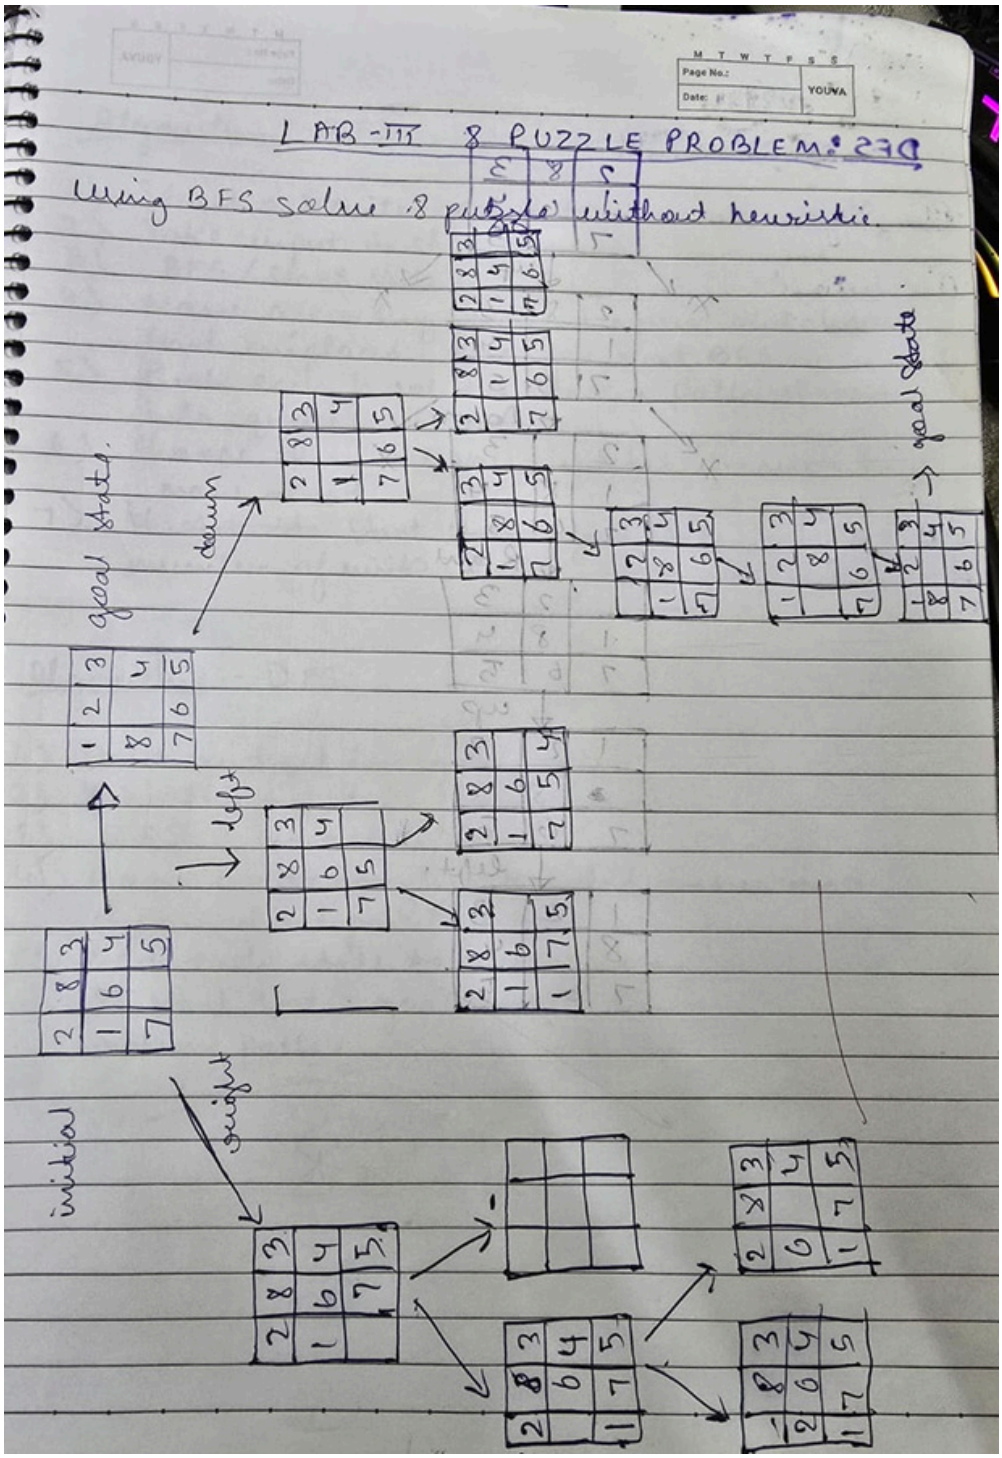
print("Invalid starting location!")

print(f"Cost: {cost}") print("Room states:", rooms)
```

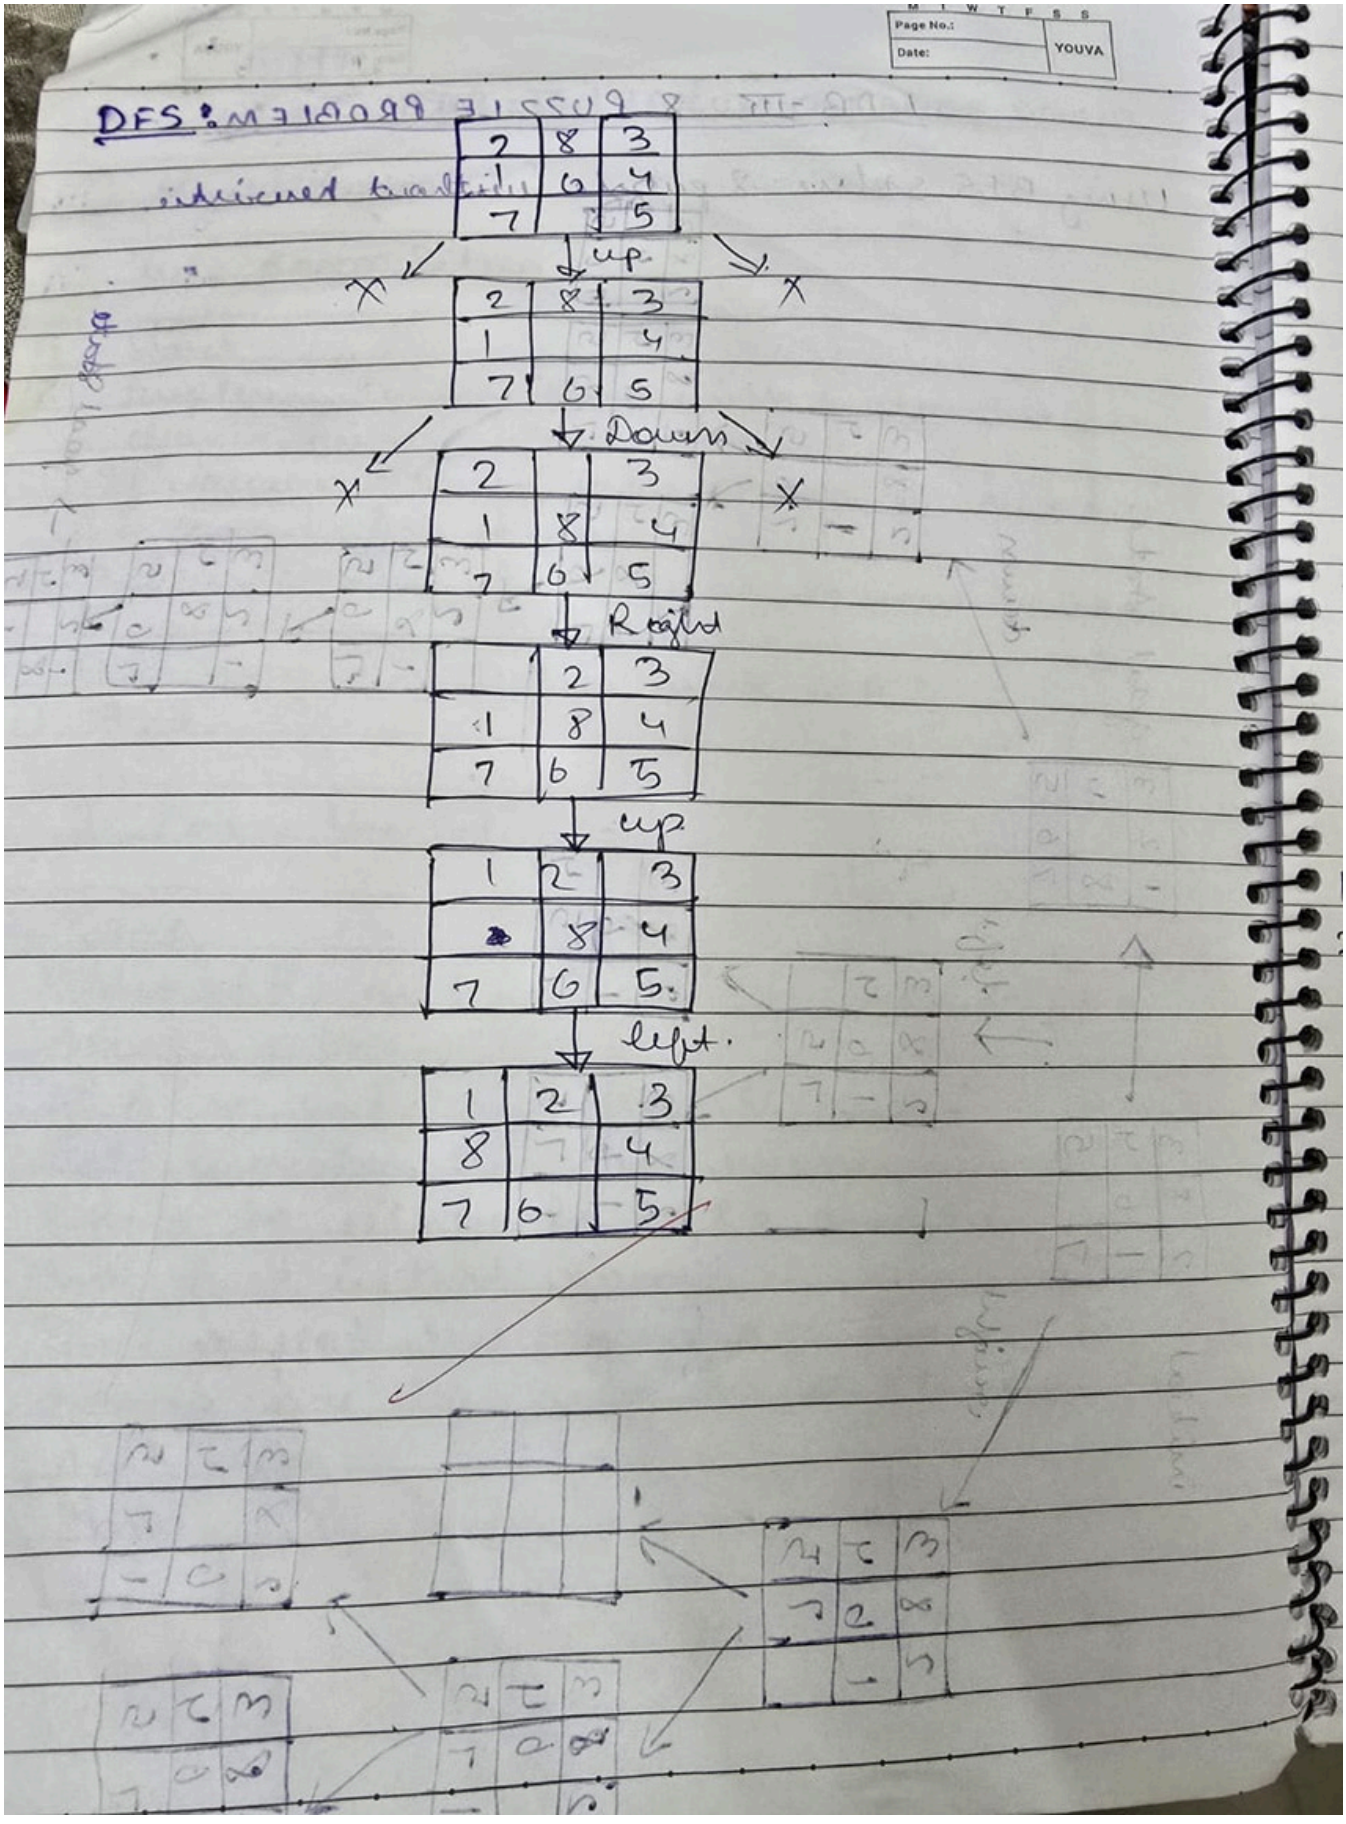
Program 2

Implement 8 puzzle problems using Depth First Search (DFS)
Implement Iterative deepening search algorithm

Algorithm:



DFS: 8 puzzle problem



M T W T F S S
Page No.:
Date:
YOUVA

Algorithm : BFS

1.) Start - Write goal state
2.) Take input in string form
3.) BFS (start state)
4.) Move according to valid moves and choose least misplaced tile for next BFS.
5.) Push each h value, state, path chosen into queue.
6.) Choose the least valid visited branch and move ahead.
7.) If start state = goal state, calculate number of visits.

Algorithm :- DFS.

1.) Start and get the goal state.
2.) Take the input in string form.
3.) DFS (start state)
4.) Move accordingly to valid moves and choose least possible tile
5.) Add each state to recursion
6.) If start state = goal state, return path.

01.09

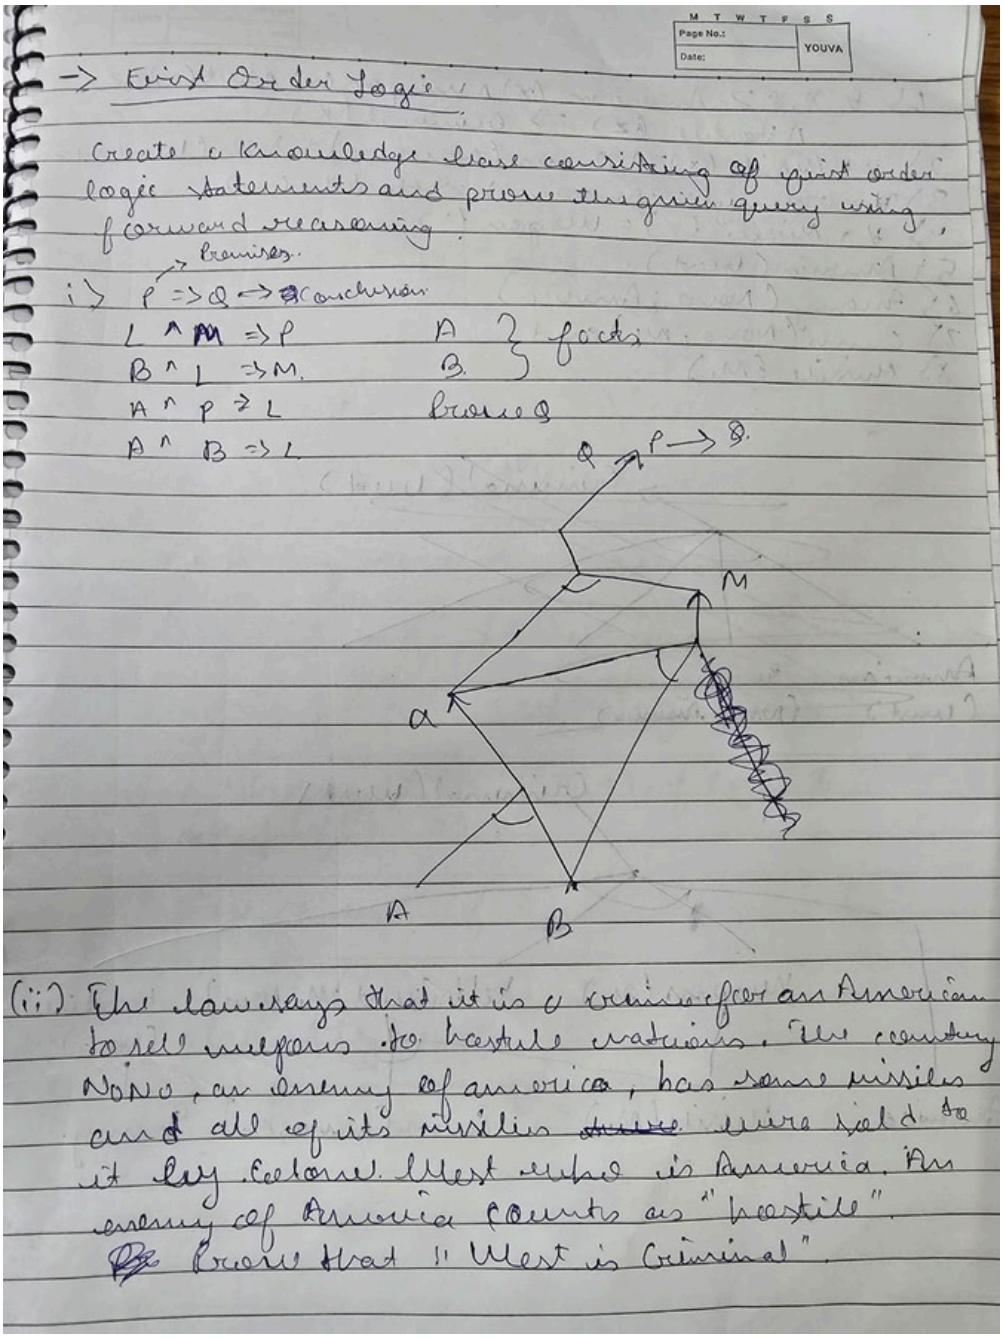
Program 8

Create a knowledge base consisting of first order logic statements and prove the given query using forward reasoning.

Algorithm:



Code:

facts = {

```
    'American(Robert)': True,
    'Hostile(A)': True,
    'Sells_Weapons(Robert, A)': True
}
If American(X) and Hostile(Y) and Sells_Weapons(X, Y), then Crime(X)
def forward_reasoning(facts):

 If American(X) and Hostile(Y) and Sells_Weapons(X, Y), then Crime(X)
    if facts.get('American(Robert)', False) and facts.get('Hostile(A)', False) and facts.get('Sells_Weapons(Robert,
A)', False):
        facts['Crime(Robert)'] = True

forward_reasoning(facts)

if facts.get('Crime(Robert)', False):
    print("Robert is a criminal.")
else:
    print("Robert is not a criminal.")
```

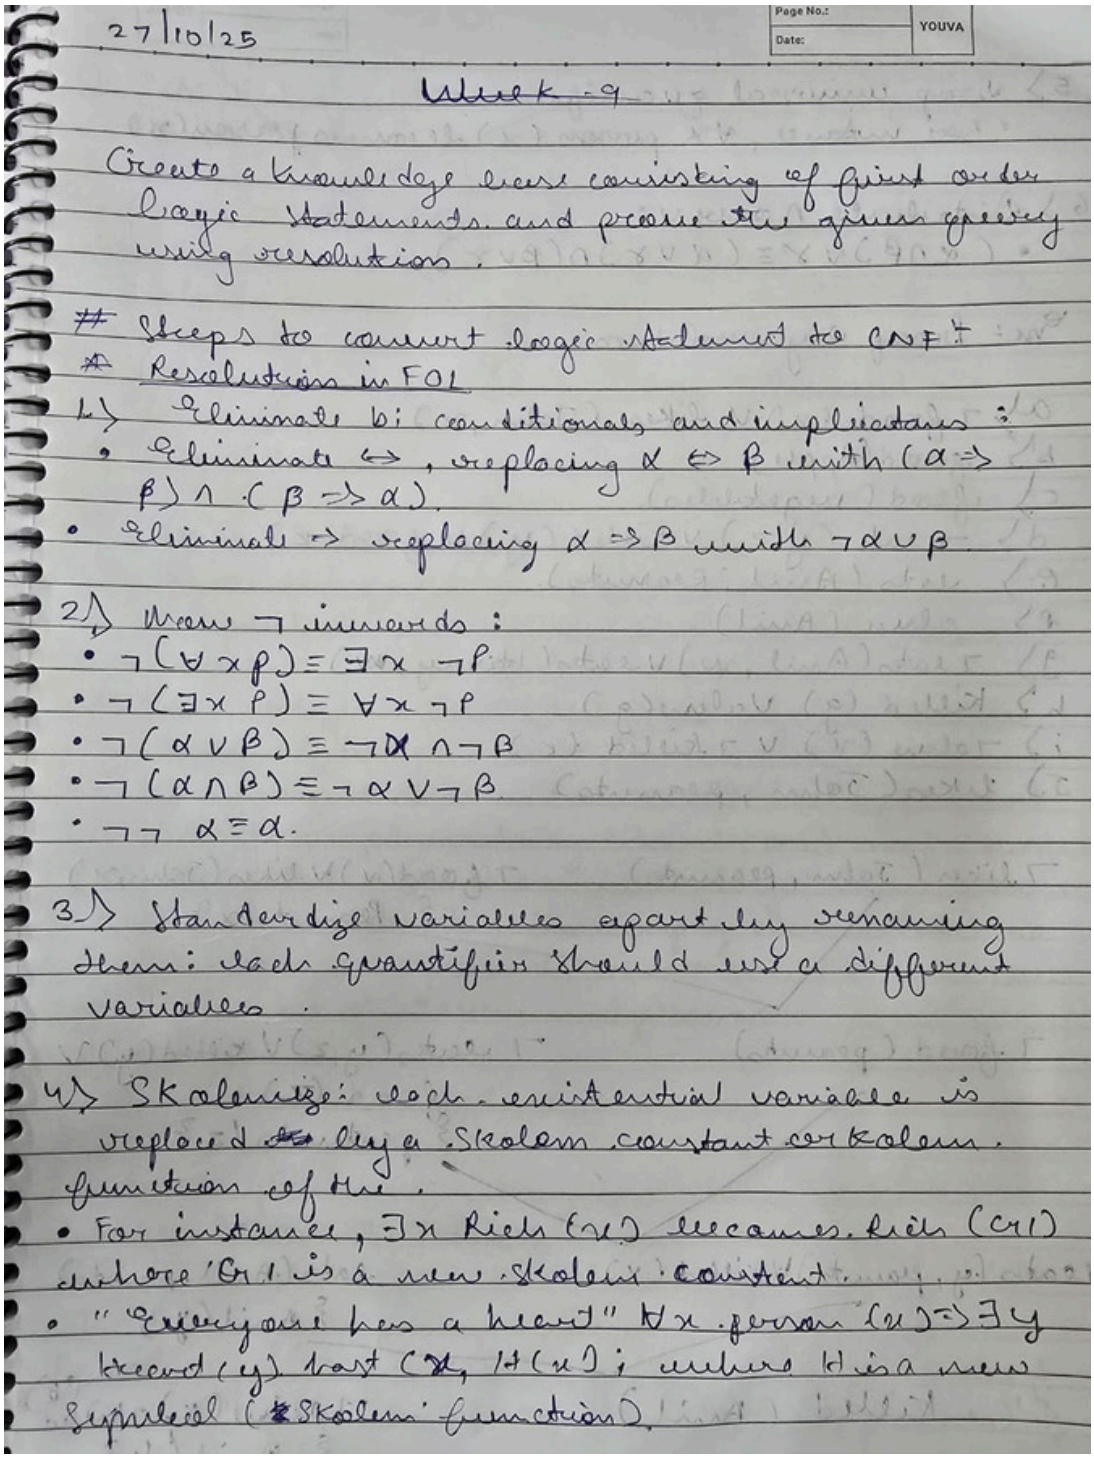
Output:

Robert is a criminal.

Program 9

Createaknowledgebase consisting of first order logic statements and prove the given query using Resolution

Algorithm:



27/10/25

Page No.:
Date:
YOUVA

Week - 9

Create a knowledge base consisting of first order logic statements and prove the given query using resolution.

Steps to convert logic statement to CNF:

* Resolution in FOL

1) Eliminate bi conditionals and implications:
   - Eliminate $\Leftrightarrow$, replacing $\alpha \Leftrightarrow \beta$ with $(\alpha \Rightarrow \beta) \wedge (\beta \Rightarrow \alpha)$.
   - Eliminate $\Rightarrow$ replacing $\alpha \Rightarrow \beta$ with $\neg\alpha \vee \beta$.

2) Move $\neg$ inwards:
   - $\neg(\forall x\, p) \equiv \exists x\, \neg p$
   - $\neg(\exists x\, p) \equiv \forall x\, \neg p$
   - $\neg(\alpha \vee \beta) \equiv \neg\alpha \wedge \neg\beta$
   - $\neg(\alpha \wedge \beta) \equiv \neg\alpha \vee \neg\beta$
   - $\neg\neg\alpha \equiv \alpha$.

3) Standardize variables apart by renaming them: each quantifier should use a different variables.

4) Skolemize: each existential variable is replaced by a Skolem constant or Skolem function of the.
   - For instance, $\exists x$ Rich (x) becomes Rich $(G1)$ where 'G1' is a new Skolem constant.
   - "Everyone has a heart" $\forall x$ person $(x) \Rightarrow \exists y$ heart $(y) \wedge$ has $(x, H(x))$; where H is a new symbol (Skolem function).

Code:

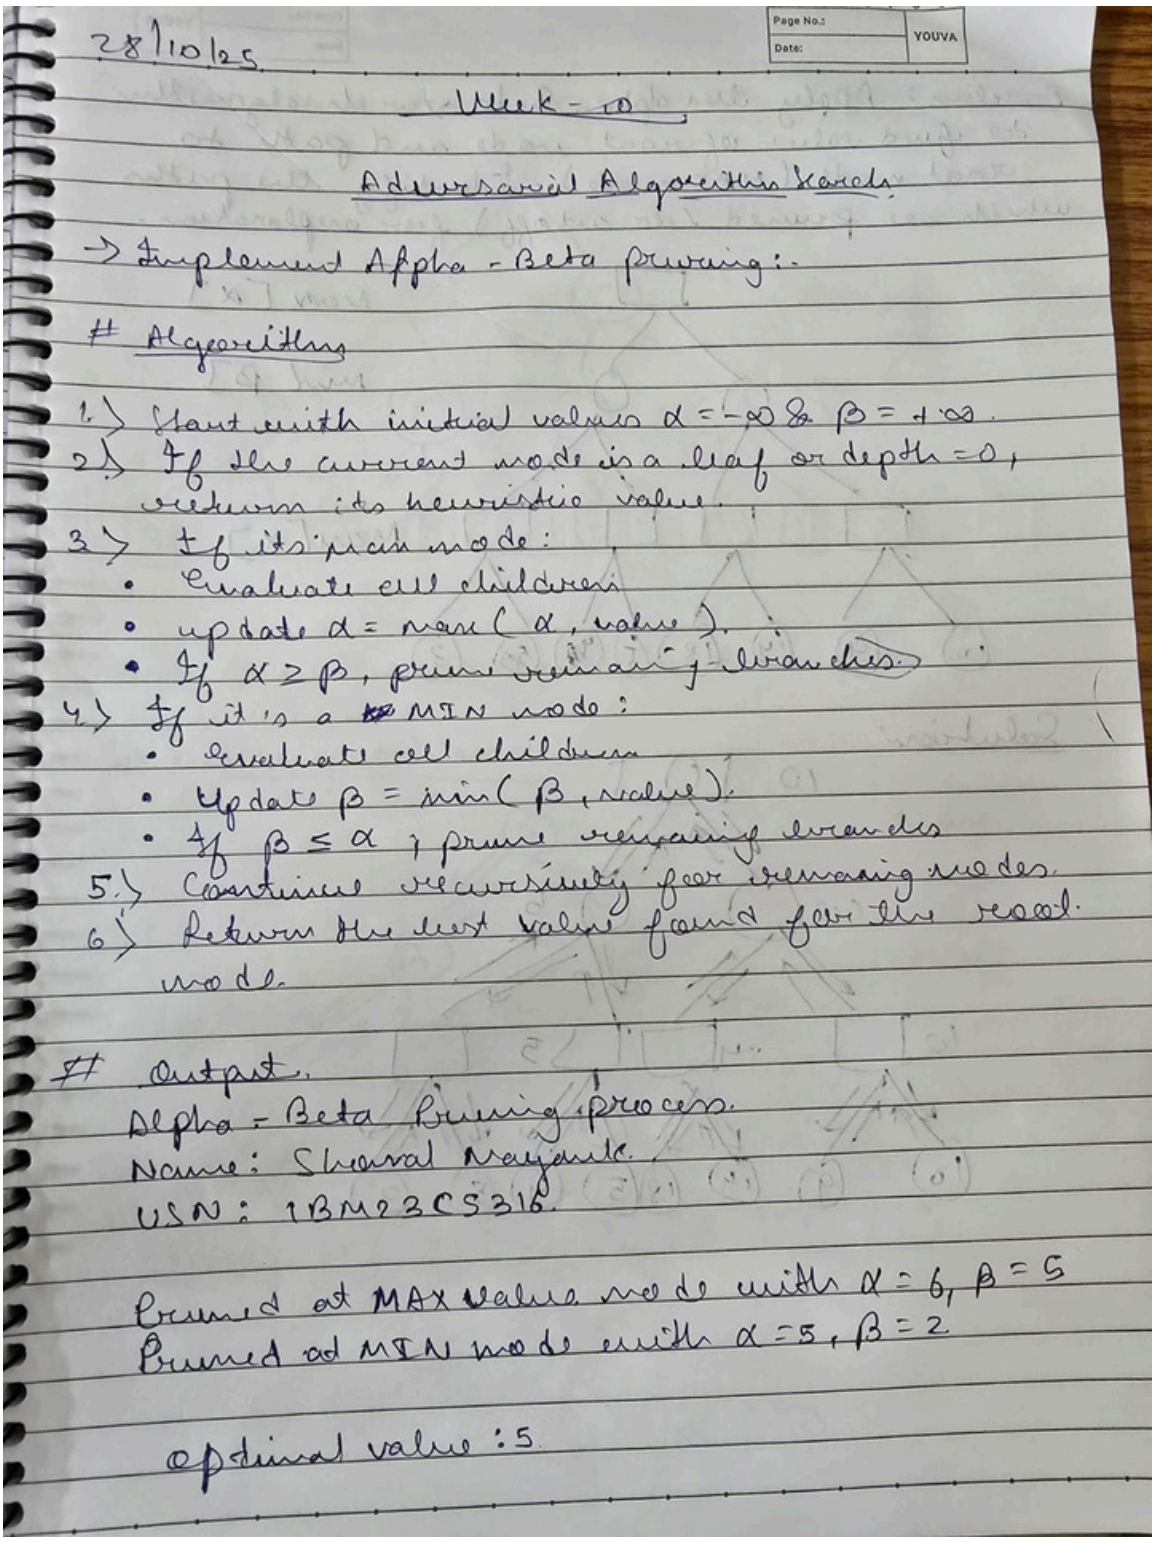
Program 10

Implement Alpha-Beta Pruning.

Algorithm:



28/10/25

Page No.:
Date:
YOUVA

Week - 10

Adversarial Algorithm Search

→ Implement Alpha - Beta pruning:-

Algorithm

1.) Start with initial values $\alpha = -\infty$ & $\beta = +\infty$.
2.) If the current node is a leaf or depth = 0, return its heuristic value.
3.) If it's max node:
- Evaluate all children
- update α = max(α, value).
- If $\alpha \geq \beta$, prune remaining branches.

4.) If it's a MIN node:
- Evaluate all children
- Update β = min(β, value).
- If $\beta \leq \alpha$, prune remaining branches

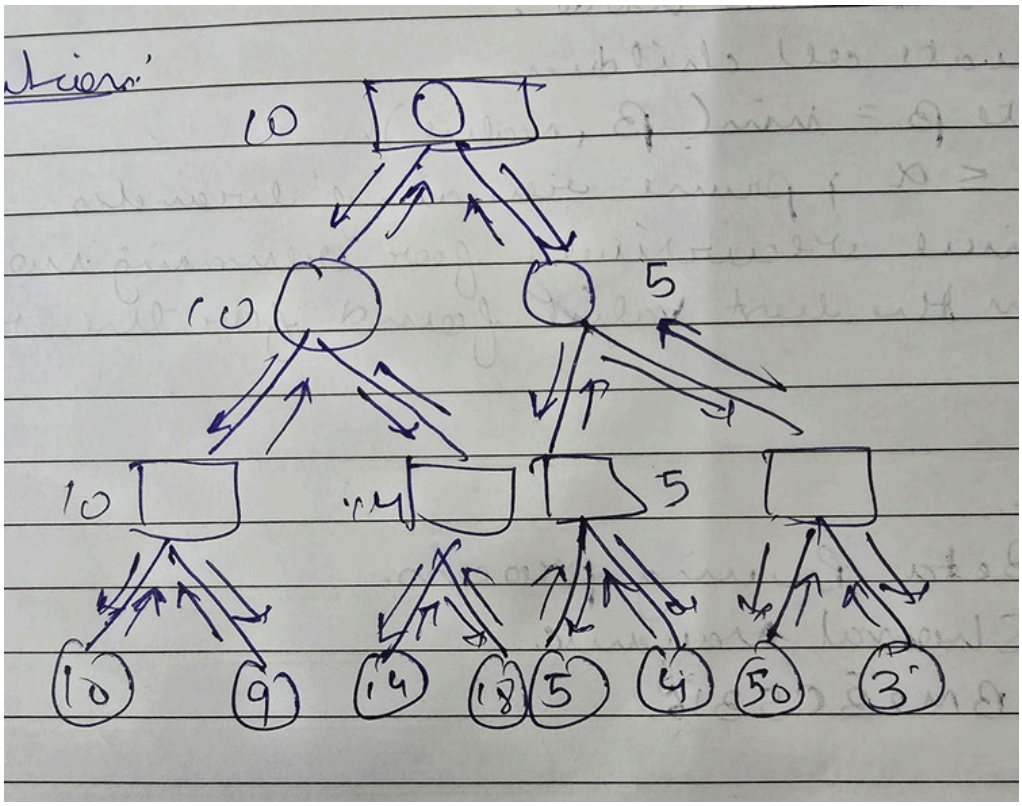
5.) Continue recursively for remaining nodes.
6.) Return the best value found for the root node.

Output.

Alpha - Beta Pruning process.
Name: Sharad Nayaka.
USN: 1BM23CS316.

Pruned at MAX value node with $\alpha = 6, \beta = 5$
Pruned at MIN node with $\alpha = 5, \beta = 2$

optimal value : 5



Code:

```
